Nursing Insights

A platform to measure and improve Purposeful Hourly Rounding and Bedside Shift Reports

Nurse rounding and bedside shift reports are two of the most critical and routine nursing activities for patient safety and experience.

Nurses understand the importance of these tasks, however time constraints, outdated documentation methods, and uneven workloads can impact their ability to complete them. In fact, nine out of ten nurses admit to missing essential care activities during each shift.

Nursing leaders can leverage the SwipeSense Nursing Insights application to capture actionable, real-time data on time-based activities, helping teams sustain and measure Purposeful Hourly Rounding and Bedside Shift Reporting performances.

Nursing Insights enables your organization to:

Prevent Avoidable Harm

Proper nurse rounding ensures patients are visited on a consistent basis, eliminating long absences and preventing harm, such as patient falls and pressure ulcers

Improve Patient Experience

Boost safety and quality scores for patient falls, nurse communication, and staff responsiveness, set by organizations, such as The Leapfrog Group and CMS to improve patient satisfaction

Reduce Clinical Waste

As organizations shift from volume to value, hospitals can lower avoidable expenses by reducing the occurrence of harm, allowing nursing teams to efficiently allocate resources where needed

Reduce harm and waste at the point of care:

Hospital leaders are constantly focused on achieving zero harm, seeking ways to eliminate preventable harm and the financial implications:

~1 MILLION
Patient falls recorded in U.S. hospitals annually

———

$14,000
Average cost of a patient fall

———

MORE THAN 50%
Of falls that preceded gaps in care are greater than 60 minutes

Nursing Insights improves Purposeful Hourly Rounding and Bedside Shift Reporting by:

Automated rounding and bedside shift compliance reports provide retrospective facility and department data, enabling nurse managers to identify specific opportunities for clinical and operational improvement

Room occupancy EMR integration ensures relevant rounding scenarios are accurately recorded only for occupied patient rooms

Automated data capture through our sensor network measures nursing time at the bedside without impacting workflow or adding additional screens between a clinician and patient

Training and engagement resources facilitate staff-wide understanding of how to properly carry out a quality round, encouraging collaborative adoption and positive behavior change

Insights that inspire action.
